

Assignment - 2

Underground Space Technology (MND407)

Max. Marks: 10

Instructions: Last date of submission of Assignment - 21st April 2026

Q. No.	Question	Marks
1	a) Illustrate the step-by-step excavation sequence of an underground rock cavern with a height exceeding 25 meters for storage of petroleum products. Why is the "Heading" usually restricted to 5 to 8 meters in height? Discuss the advantages of this method regarding machinery access and stress relief. b) Design a typical blast pattern for a large-span rock cavern heading. c) Propose a comprehensive instrumentation plan for a 100 m long cavern from the excavation phase through the first filling of the storage product. What are the "Trigger Levels" (Alert, Action, Alarm) in geotechnical monitoring?	10
