

**Department of Mathematics & Computing**  
**Lecture Plan, Session: 2023-24 (Monsoon Semester)**

| Course Type | Course Code | Name of Course             | L | T | P | Credit |
|-------------|-------------|----------------------------|---|---|---|--------|
| DC          | MCC505      | Probability and Statistics | 3 | 0 | 0 | 9      |

| Course Objective                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| To offer a foundation in probability theory and statistical inference in order to solve applied problems and to prepare for more advanced courses in probability and statistics.                                                                        |
| Learning Outcomes                                                                                                                                                                                                                                       |
| This course provides a solid undergraduate foundation in both probability theory and mathematical statistics and at the same time provides an indication of the relevance and importance of the theory in solving practical problems in the real world. |

| Unit No. | Topics to be Covered                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Lecture Hours | Learning Outcome                                                                                                               |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------|
| 1        | Definition of statistics, types of data, concept of frequency distributions. Measures of Central Tendency: Mean, median, mode, quantiles. Measures of Dispersion: Range, mean absolute deviation, standard deviation, variance, covariance, coefficient of variation and moments, relation between first four central and raw moments. Skewness and kurtosis: measures of skewness and kurtosis.                                                                                                       | 5             | To understand the nature and deviation of data.                                                                                |
| 2        | Events, sample space, definitions of Probabilities, Theorems of Probabilities (without proof): Addition, Conditional Probability and Multiplication, Bayes theorem, and its proof with application based on numerical problems. Random variables; discrete and continuous, probability functions: pmf and pdf, Joint, marginal and conditional probability distributions. Mathematical expectation and its properties. Moment generating and characteristic functions. Exercises based on above topics | 10            | To understand the logic of probability. To find the descriptive statistics of distribution through moment generating function. |
| 3        | Statements (without proof) of Markov and Chebyshev inequalities and its applications based on numerical problems. Statements of Law of large numbers: WLLN, SLLN, Central limit theorem. Numerical problems based on above topics.                                                                                                                                                                                                                                                                     | 4             | To obtain the different probability bounds of data.                                                                            |
| 4        | Definitions, MGF, mean and variance of the following Probability distributions: Discrete: Uniform, bernoulli, binomial, negative binomial, geometric, hyper geometric, Poisson probability distributions. Continuous: Uniform, normal, lognormal, cauchy, exponential, gamma, beta, weibul probability distributions. Definitions & uses of sampling distributions: Chi-square, t and F, distributions of smallest, largest order statistics and range                                                 | 14            | To understand the concepts of a random variable and analyze the ideal patterns of data.                                        |

|   |                                                                                                                                                                                                                                                                                                                                                                                                                                 |   |                                                                                                    |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|----------------------------------------------------------------------------------------------------|
| 5 | Definition of Karl Pearson correlation coefficient and its properties for bivariate data, Spearman's rank correlation coefficient with examples. Concept and derivations of regression lines, properties of regression coefficients. Plane of regression (three variables case) and derivation of regression coefficients. Definitions (without proof) of multiple and partial correlation coefficients and numerical problems. | 6 | To know the relationship between variables and predict (estimate) the value of dependent variable. |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|----------------------------------------------------------------------------------------------------|
