

10

Saturday $(\bar{y} - \bar{y}) = \delta_{xy} \frac{\partial y}{\partial x} (x - \bar{x})$ 2001 --- (1)

$$(\bar{r}-\bar{r}) = \delta x_y \frac{\partial y}{\partial x} (x-\bar{x}) - (1) \quad 20$$

$$(x - \bar{x}) = r_{xy} \frac{\sigma_x}{\sigma_y} (y - \bar{y}) \quad \text{--- (2)}$$

$$m_1 = \gamma_{xy} \frac{\partial y}{\partial n}, \quad m_2 = \frac{1}{r} \frac{\partial y}{\partial n}$$

~~Let~~ Let the angle between two lines (1) & (2) is θ .

$$\therefore \tan \theta = \frac{m_1 \omega m_2}{1 + m_1 m_2} = \frac{r \frac{\partial y}{\partial n}}{\frac{1}{\omega} + \frac{f \frac{\partial y}{\partial n}}{\omega}}$$

$$= \frac{(x^2 + y^2 - 1) \frac{\partial u}{\partial x} + x \frac{\partial u}{\partial x}}{x(x^2 + y^2 - 1)}$$

$$\therefore |x| \leq 1$$

$$\text{if } r > 1 \quad \theta = 0$$

lines are coincident

if $r \geq 0$, $\theta = 90^\circ$

lines are perpendicular air

 $\gamma > 0$
