A decorative vertical bar on the left side of the slide. It features a repeating pattern of medical icons: a red cross on a white background, a blue bandage, and a blue magnifying glass. The icons are arranged in a grid-like fashion, with some overlapping. The colors are primarily red, blue, and white.

The basics of understanding health and healthcare:

- The levels of care – *Primary care* (first level of care one receives...including health promotion, disease prevention, treatment and rehabilitation), *Secondary care* (specialist treatment... within a healthcare setting) and *Tertiary care* (advanced and complex diagnostics...over an extended period of time)
 - *Why we should focus on the primary care!!*
- Healthcare should be contextualised with reference to the social stratifications

A decorative vertical bar on the left side of the slide, featuring a repeating pattern of medical icons: a nurse's head, a bandage, and a magnifying glass over a heart. The icons are in shades of blue, red, and orange.

Models of Healthcare

Medical model of health

“The dominant disease model is biomedical, with molecular biology as its basic scientific discipline. The biomedical model assumes **diseases** to be a **deviation from the norm of measurable variables**, without accounting for the **social, psychological and behavioral** dimensions of illness”.

- **Explanations**...basic assumptions about a) the functioning of the human body and b) the nature of disease.
- **Features**...the way in which it assumes the existence of a **dichotomy between mind and body** in the conceptualization of disease

Assumptions:

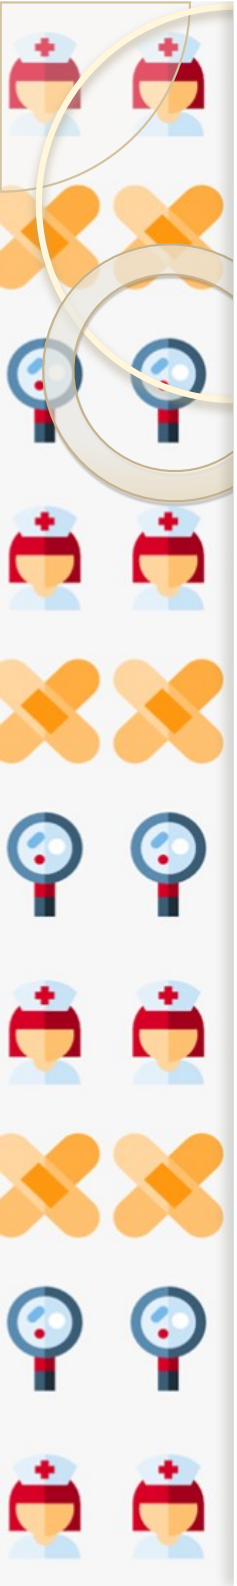

‘mind–body dualism’:

‘mechanical metaphor’:

‘technological imperatives’:

‘reductionist tendency’:

‘doctrine of specific aetiology’

A decorative vertical bar on the left side of the slide. It features a repeating pattern of medical icons: a red cross on a white background, a blue bandage, a blue magnifying glass, and a red cross on a white background. The icons are arranged in a grid-like fashion, with some overlapping and some separated by thin lines.

Criticism of medical model

- Criticism has come from three sections
- These are broadly labelled as: ‘pragmatic’ or ‘fundamental/practical’

Social construction of medical knowledge

- Medical knowledge has changed over time...**from four humours to germ theory**
- Three paradigms of medical knowledge:
 - Bedside medicine
 - Clinical medicine
 - Laboratory medicine
- Each paradigm describes a shift in the nature of **relationship between the practitioners and the patient**

A decorative vertical bar on the left side of the slide. It features a repeating pattern of medical icons: a red cross on a white background, a blue bandage, and a magnifying glass over a red cross. The icons are arranged in a grid-like fashion, with some overlapping.

Social model of health

- **Transition** from past to 20th and 21st century
- What distinguishes...**causes are social**
- Risk factors are one aspect, others being the kind of society we live
- Health is no longer separated from the **lived experiences of everyday life**
- **Individual** to have good/poor health Vs. **society** that causes good/poor health
- Health is widely perceived in ‘**individualistic term**’
- A ‘**biopsychosocial model**’ includes the patient as well as the illness
